

Pedestrian access control for GYM in Cali, Colombia

Industry

Entertainment

Location

Colombia

Solution

Access Control

About Client

An integrated pedestrian access control system was installed to optimize member entry management, enhancing overall security, organization, and operational efficiency within the gym. The solution focuses on regulating customer access, reducing unauthorized entry, and ensuring a smooth flow of people during peak hours.

The installation includes mTS1000 and TS1000 Pro turnstiles, designed for reliable and continuous operation in high traffic environments, delivering fast, safe, and controlled access for gym members and staff.

Requirements

The client required a secure and durable pedestrian access solution capable of managing a high volume of daily users. The system needed to improve security, restrict access exclusively to registered customers, minimize congestion, and provide consistent performance with low maintenance.

Solution

The project was implemented through the installation of multiple mTS1000 and TS1000 Pro turnstiles at the main entrance. These devices regulate pedestrian flow and allow only authorized users to enter the facility. This configuration ensures secure access control, organized circulation, and a safer, more professional environment for both members and staff.

Configuration

System	Type	Model
Access Control	Turnstiles	TS1000 Pro
	Turnstiles	mTS1000
	Accessories	K2
